In the claims:

For the Examiner's convenience, all pending claims are presented below.

(Previously Presented) An apparatus, comprising: 1.

a printed circuit board having a first surface of the material of the printed circuit

board, itself, and a mounting hole formed through the firsts surface and the material of

the printed circuit board;

a solder ring disposed upon the first surface of the material of the printed circuit

board, itself, and surrounding the mounting hole formed through the first surface and

material of the printed circuit board, itself; and

a ferrule having a body with a channel formed therethrough from a first end of the

body having a capture extension, to a second end of the body having a soldering

extension in the form of a solder flange providing a soldering surface to solder the ferrule

to the solder ring at a location overlying the solder ring where the channel formed

through the ferrule and the mounting hole formed through the first surface and material of

the printed circuit board, itself, align.

(Original) The apparatus of claim 1, wherein the ferrule is substantially 2.

cylindrical in shape.

3. (Canceled)

(Original) The apparatus of claim 1, wherein the capture extension is used to hold 4.

a screw protruding through the channel formed through the ferrule captive to the ferrule.

Docket No.: 42P12029

Application No.: 10/017,613

2

5. (Original) The apparatus of claim 4, wherein the capture extension is a capture

flange surrounding the channel formed through the ferrule at the first end.

6. (Original) The apparatus of claim 4, wherein the screw is comprised of a head

installed within an overmold having at least one extension that engages the capture

extension, and that cooperates with the capture extension to hold the screw captive to the

ferrule.

7. (Previously Presented) The apparatus of claim 4, wherein the ferrule is used in

cooperation with the screw protruding through both the channel formed through the

ferrule and the mounting hole formed through the material of the printed circuit board,

itself, to mount the printed circuit board.

8. (Original) The apparatus of claim 7, wherein a spring is positioned within the

channel formed through the ferrule to bias the screw into a predetermined position when

the screw is not being used to mount the printed circuit board.

9-22 (Canceled)
